AGX Forensolution

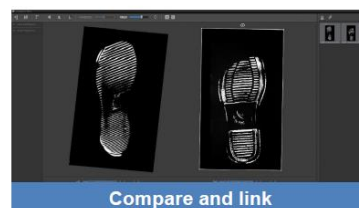

Footwear Impression Automated Matcher System

The new Forensolution or (FIAMS) is a sophisticated shoeprint matching system that helps criminal investigation specialists to narrow crime suspects by identifying their shoes, solving investigations faster and efficiently.

FIAMS provides an efficient workbench interface to upload shoeprints directly from your computer, search the database, edit case information, link shoeprints from different cases, etc.

Search and match

Compare and link

The system uses advanced deep neural networks to match your query shoeprint against its ever-growing database, now over 88,000 shoe brands and models.

FIAMS is best used together with the Everspry EVEROS scanner to upload the high-quality images and search the database for matching results.

The system safely protects your database with its proprietary file storage and formatting techniques. The database is regularly updated, adding 5,000 models per year.
